Thermal FR Composite Piping

Technical Information Polypropylene Random Copolymer

Why choose this type of material?

The thermoplastic resins most often used to make pipes for water and heating systems are:

- PE-X cross linked polyethylene
- PP-C copolymer polypropylene
- PB polybutene

All the above - mentioned resins belong to the polyolephine family, a group of plastic materials obtained by polymerization of unsaturated hydrocarbons, which have one or more double links.

In a conventional polymer the molecular chains are irregularly placed; they have fairly good mobility, heat causes oscillation in these chains until they break, resulting in alteration of the material's characteristics. Two ways of preventing this problem have been tested.

Researchers have selected polymers with long molecular chains because, as molecular weight increases, the mechanical characteristics of manufactured items improve; these chains must be as linear as possible, i.e. they must show a low number of ramifications and a high degree of crystallization by extrusion these chains are submitted to stretch, allowing crystallization of a further percentage.

Isotactic polymers show much better mechanical characteristics as compared to their correspondent amorphous polymers; they maintain their properties up to temperatures close to melting point. This describes the nature of polypropylene techno- polymers in a simple way.

The other way tested by researchers is creation of chemical links among molecular chains in order to make them much steadier and avoid their sliding. This procedure has been adopted for the cross linking of polyethylene-PE- X.

There is a very big production of PP copolymers it is therefore important that fitness of raw material used be proven; it must be suitable to bear the thermo mechanical stresses required of it in operation for a long time (50 years).

Thus it is guaranteed that goods manufactured have high mechanical properties; it has been stabilized with appropriate anti-oxidants to postpone the combined effects of pressure and temperature for a very long time.

PROPERTY OF RAW MATERIAL

KPT- PPR Plumbing Pipe system is made from Basel & Hyosung materials which are considered as one of the best PPR-C material all over the world, a Random Copolymer Polypropylene (PPR-C) approved for the production of pipes and fittings according to DIN 8078 & DIN 16962 standards. Hyosung PPR Raw material is a thermoplastic resin which is transformed in to the finished product by a rise in temperature, which plasticises the material, allowing the pipe to be produced by means of EXTRUSION, and the fittings by MOULDING. The raw material is supplied in granules precolored. Special heat resistance is one of the features of this material, Its physical and chemical properties are well suited to the transfer of potable water and in the heating sector. Depending on pressure it is possible to use KPT - pipes for constant temperatures up to 70°C with service life of more than 50 years. Peak temperatures of 100°C arising from short disruptions are not creating any problems.

Advantages of KPT PPR-C Piping System

KPT pipes and fittings are made from polypropylene random copolymer specially developed for this use. Its characteristic make it suitable for both Industrial and Commercial applications with outstanding reliability over time.

One special feature of the KPT PPR-C pipe system is the assembly technique, in which the parts to be connected are welded by melting and fusion. After fusion welding, the pipe and fittings form a single continuous body with none of the problems, which may derive from potential leakage points. This makes the joints as PERMANENT. No sealants or adhesives are required for these permanent connections.

Special Features of KPT PPR-C Piping System

Anti Corrosive & Chemical Resistant - Chemically inert and highly resistant to wide range of acid bases. Suitable for highly corrosive areas and industrial cooling water, drinking water system.

Withstanding High Pressure - Pipes and fittings can withstand up to 20 kg/sqcm pressure. Suitable for high pressure application like Compressed Air Lines.

Low Pressure Drop - Because of the very smooth non porous inner surface of pipes and fittings the pressure loss is less than metallic pipes, which results saving of pumping energy considerably.

Withstanding Higher Temperature - Can withstand upto 95°C. Best pipe for heated water transport in solar applications.

Hygienic & Harmlessness - KPT PPR-C pipes are certified as food grade pipes as per DIN 1998 T2. Best piping system for drinking water, RO plants and DM Plants.

Low Thermal Conductivity - The material's high level of thermal insulation guarantees low heat loss on the part of fluid transport. (0.24 W/mK)

Low Noise - Having high sound insulation value, results in lower noise level at the time of high velocity flow.

Non Toxic - Recyclable - Unlike PVC pipes, KPT PPR-C pipes are non toxic at the time of fire. PPR-C is recyclable material.

High Impact Rate - KPT PPR-C pipes are having high impact strength compare to any plastic pipe.

Low Flammability - KPT PPR-C pipes and fittings comply with fire classification B2 (normal inflammable). In case of fire no toxic emission to atmosphere like PVC pipes.

Resistant to stray electrical current - Thanks to high electrical insulating properties, KPT PPR-C pipe system is unaffected by stray currents

Like SS Pipe - The characters of KPT PPR-C piping system is almost like SS. KPT PPR-C pipes will have more advantage than SS for the specific application requirements.

RESISTANCE TO CHEMICALS

Polypropylene has high resistance to a large number of aggressive substances, and is therefore particularly suitable for special applications. The table below provides resistance of Polypropylene to various chemicals. For transport of combustible fluids, please comply with any legal regulations in force. Take care when the installation is to carry water with chlorine content over the limits permitted by law and/or contains elements which induce oxidation in general.

Testing

KPT is having in house testing facility to do above tests as per the BIS, DIN and NSF Standard for:

- Testing of incoming Raw material.
- Final inspection and dispatch.
- Inspection and testing during production as per standards.
- Periodical calibration of testing equipments

FUSION METHOD

The process of joining PPR-C pipes and fittings is very simple and results in inseparable watertight joints. It is carried out using a simple welding machine that fuses the internal surface of the fitting and the external surface of the pipe, so that the material of the pipe and the fitting will be bonded together.

THE FOLLOWING DESCRIBE THE STEPS OF THE WELDING PROCESS

Prepare the welding machine by fitting it with the welding dies of the diameters to be welded. Connect the plug to the 220V power supply socket and wait until the green light on the machine goes out indicating the welding machine has reached the working temperature.

- Cut the pipe at right angles to the pipe axis using suitable pipe cutter.
- Remove any burrs or cutting chips by deburring the cutting area.
- Mark the welding depth on the pipe using suitable marker.
- Insert the end of the pipe without turning into the heating sleeve up to the marked welding depth and at the same time slide the fitting without turning into the other side of the heating tool up to the stop. It is essential to observe the mentioned heating times (refer to the below table)
- Leave the pipe and fitting into the heating tool until the heating time is elapsed.
- At the end of the heating time, remove the pipe and fitting from the heating tool and push them immediately against each other up to the mark indicating the welding depth. At this stage the depth mark will be covered with the welding bead.
- During this process, do not rotate the pipe and fitting relative to each other.
- Allow the joint to cool fully before using.

STEP 01

STEP 02

RESULT

HOLE REPAIRING

If a hole is accidentally made in the pipe (with a drill bit or screws) and if the hole is in only one side of the pipe, it can be repaired using the hole repairing die, bearing in mind that the pipe size must be compatible with the die diameter.

THE REPAIR PROCEDURE IS AS FOLLOWS:

- Clean and dry the part to be repaired.
- Fit the male part of the Hole repairing die into the hole; it must melt the surface to be adjusted by the operator to suit the pipe thickness, to ensure that the die cannot be inserted too far and melt the other side of the pipe. To make this adjustment, undo the screw which fixes the bush and then move it along the die.
- At same time as the male part of the die melts the area around the hole, the female part melts the repair bar usually supplied with die. Once the heating time has passed (5sec.) the repair bar must be inserted in the hole. When this operation is complete, wait for everything to cool and then cut off the excess part of the repair bar.
- If the diameter of the hole to be repaired is greater than that of the die, or both sides of the pipe are punctured, the piece of pipe must be cut out and the repair made using normal pipe fittings.

STEP 01

STEP 02

RESULT

FUSION TECHNIQUE II

WELD-IN SADDLE TECHNIQUE

Branches can easily be made by weld-in saddles, even at a later stage of installation. By using weld-in saddles you save material and time. Whereas in case of tees three joints have to be welded, installation of saddle is restricted to mounting the saddle and branch pipe only.

Steps Follows

- Drill the pipe
- Warm up the saddle
- Pipe wall and outside pipe
- Connect the elements

STEP 01

STEP 02

RESULT

ADVANCED BUTT WELDING TECHNOLOGY

KPT is having advanced US and Italian made machines to perform butt welding procedures on sizes above 110MM. Internationally butt jointing is the most suitable and acceptable procedure for sizes like 160MM, 200MM, 250MM and beyond to adhere to the best quality and durable international standards

Step 01

Step 02

Step 02

Result

Joining method of KPT PPR-C piping systems

CUTTING

1. Cut the pipe right angle to its axis using burr free cutter.
2. Ensure that pipes is free from burrs or cutting chip
3. Clean the pipe & fitting perfectly before welding.
4. Mark welding depth at the end of pipes.

HEATING

1. Mount the suitable dies on heating element of welding machine according to the diameter of Pipe and fitting to be welded.
2. Connect the welding machine to 220/230 volts A.C. power supply.
3. Select 260 Deg. C. temperatures on the welding machine thermostat.
4. Wait for reaching the required working temperature.
5. Insert the pipe and the fitting in the dies by exerting light pressure.
6. For heating time, refer the table given for different sizes of Pipes.

WELDING

1. After heating, quickly insert pipe into the fitting by exerting light pressure.
2. Any misalignment should be corrected immediately after insertion to avoid any Stress in the weld.
3. Allow the joint to cool as per cooling time given in table. This type of connection ensures perfect sealing even under the severe working Conditions.

Recommended Time For PPR Systems Fusion Joints

| PIPE DIA. (MM) | WELDING MACHINE TEMPERATURE °C | | | WELDING DEPTH (MM) | HEATING TIME (SEC) | WELDING TIME (SEC) | COOLING TIME (MIN) |

PNEUMATIC PIPES & FITTINGS

PNEUMATICS AND COMPRESSED AIR PLUMBING PIPING SYSTEM

With a service life of atleast 50 years once installed, tight and safe

connection heating & cooling

wall heating

chilled water technology

application in the field of ship building

swimming-pool technology

district heating pipeline systems

chemical transport

geothermal

irrigation

Pneumatic and Compressed Air Plumbing piping system

K.P.T. PneumatoPipes combine the advantages of FRP and plastic pipes and eliminate the disadvantages of both materials at the same time. The FRP is absolutely diffusion tight and reliably prevents oxygen or gases from permeating into the pipe. It compensates and reduces snap-back forces and heat expansion with changes in temperature. K.P.T. Pneumato pipes are being produced with latest German technology at its state of the art manufacturing unit at Dehradun, Uttarakhand, India. K.P.T. Pneumato pipes has been specially designed for the creation of primary and secondary network for compressed air, neutral gases & Vacuum. The FRP allows K.P.T. Pneumato Pipes to withstand high working pressure and prevent oxygen and gases from permeating into the pipe. K.P.T. Pneumato pipes are safe and reliable choice for compressed air, gas and oxygen supply.

K.P.T. PneumatoPipes consist of an overlapped FRP with an inner and outer layer of Polypropylene Random Copolymer (PPR-C). All the layers are permanently bonded together by intermediate adhesive layers. The FRP thickness of K.P.T. Pneumato pipes has been selected to meet compressive and flexural strength requirements. Most of the industries are now slowly moving away from MS/GI piping system for compressed air transportation owing to following problems:

Reinforcement Glass Fiber

The Sandwich Glass Reinforcement technology processed on Pneumato enables to withstand more pressure even in high temperature. Since Glass is non-conductor of heat, so there is lesser thermal expansion, this reduces sagging.

U.V. Resistant

New Pneumato technology being developed with carbon content blue layer which protects the pipes from UV rays in open sky.

Glass Insulation

Glass acts as non-conductor of heat. So the Sandwich Glass Reinforcement technology reduces the condensation, thus reduces the chances of moisture in Pneumato technology getting least.

Leaking zero

in fusion welded joints.

Rusting

Water condensation in compressed air system leads to rust formation even in joint areas of GI pipe welding, affecting costlier pneumatic equipments.

Installation Time

Threaded joints consume more time in existing repair work as well as in new projects where as fusion joints once conducted require no maintainance.

Pressure Drop

Rough inner surface in the above pipes leads to slight increase in pressure drop.

Cost

Aluminium/MS/GI piping systems are conventionally more expensive.

Atmospheric effects

Aluminium also reacts with most of the chemicals. If some chemicals are present in compressed air, that can equally effect aluminium pipes. Often aluminium pipes are available at the maximum size of 110mm only. Most of the fittings are in plastics material. These areas are then rendered mechanically weaker in the line.

K.P.T. Pneumato piping system (Blue Colour) will provide the right solution for all the above issues. KPT Pneumato compressed air application has the following features:

- 1 Compression - style fittings offer a tight, leak-free fit.
- 2 All fittings are corrosion-free and will not degrade or rust.
- 3 Smooth inner surface that reduces operational pressures required by motor/pump
- 4 High chemical resistance with no possibility of bacterial and moss reproduction within pipes.
- 5 Resistance to high temperature (110°C)
- 6 None crumbling and non-deforming properties
- 7 Non contracting diameters
- 8 Wide variety of size options to suit diverse needs from 16mm up to 355mm
- 9 K.P.T Pneumato piping joints are fusion joints and no external adhesives are used. Hence once fusion welding is done, pipes and fittings will turn into a homogeneous material and makes permanent joints.
- 10 Fusion welding technology is very simple. Any person can do it with little practice. K.P.T. will offer training and provide minimum spares to our clients to meet any emergency.

Technical Data of K.P.T. Pneumato Pipes:

| S.No. | PROPERTY | (KPT-GF) PIPE |
|-------|--------------------------------------|----------------------|
| 1 | Thermal Conductivity | 0.024 |
| 2 | Coefficient Linear Thermal Expansion | 1.0×10^{-4} |
| 3 | Flexural Modulus | 1260 |
| 4 | Tensile Strength at break | 45 |
| 5 | Melting Temperature Rate | 160-165 |
| 6 | Vicat Softening Temperature | 145.3 |

Advantages of Pneumato Pipes:

1. Very less heat loss due to lesser thermal conductivity.
2. Lesser sagging because of very less thermal expansion.
3. High temperature and high pressure with stand capacity due to inbuilt GFR reinforcement layer.
4. Since having 0.1micron RA value and mirror finish inner surface, 40% to 60% lesser friction compared to other pipe.
5. Reduced thermal expansion will reduce clamping.
6. Style fittings offer a tight, leak free fit.
7. As a result of socket Fusion joint, 0% leakage.
8. 60% layer of glass fiber reinforcement in the pipe.
9. Excellent performance with long life in direct sunlight having UV resistant on the upper layer.
10. Reduced linear expansion coefficient, only 1/3 of that of normal PP-R
11. Higher strength and stability of dimension. It can stand 25% more pressure than PP-R at the same condition
12. Improved resistant to impulse under low temperature. It can used in 90 ° for a long time
13. With the same condition of pressure, wall thickness of PPR fiberglass pipe is thinner, increasing inner diameter of the pipe, bigger of the air flow.
14. Direct connect with water table within the health of non-toxic, good scalability, no formation of sphagnum.

Saving Time and Money-Life Cycle Cost

Applications

1. Compressed Air lines for hot and cold air
2. Solar Heaters, under floor heating
3. Effluent Treatment Plants (ETP)
4. Vacuum pipelines
5. Chilled Water Application and air conditioning
6. Instrument Air
7. Nitrogen Gas
8. Chemical Plants and aggressive fluids
9. Industrial Water and Wastewater
10. Flue-gas Desulfurization
11. Pulp and Paper Mills
12. Irrigation
13. Wall Heating
14. Application in the field of ship building
15. Pharmaceuticals
16. Suitable usage for more than 400 chemicals
17. Industrial waste applications
18. Water transmission lines
19. Pressure/forced mains sewers
20. Rehabilitation applications
21. Water distribution systems
22. Storm water Drainage
23. Above ground piping
24. Sewage Drainage
25. Re-lining, Slip-lining applications
26. Desalination Plants

Conclusions and Recommendations

1. KPT brand pipes and fittings are suitable for all applications better than other traditional thermoplastics.
2. KPT brand pipes and fittings are most suitable for potable hot and cold water in building services.
3. No maintenance, **Install it forget it**
4. Commercially viable
5. Adopted in various applications

For all size of KPT Pneumato Pipe and Fittings

Allowable working pressure for KPT Pneumato Pipe and Fittings

Thermal FR+V0 Composite Piping (Flame Retardant)

A brand new from the house of KPT, we proudly introduce KPT Thermaplus pipes and fittings plumbing system for firefighting lines various other applications. The outer and middle layer of the pipes is being made of flame retardant material which can easily with stand flames for ensuring safe passage for the public at large and excellent performance with long life in direct sunlight having UV resistant on the upper layer. The middle layer glass fiber reinforced with in the two layer of PPRC act as an agent to reduce extension capability and produce durability to high pressure at high temperature. This plumbing system is ideal for all kinds of firefighting lines, Hotels, Malls, Industries, Schools, Residential Apartments etc.

KPT Thermaplus piping is preferably advisable to use in highly corrosive chemicals, higher and lower temperature applications as well as all types of process and utility applications, soft water, raw water, R.O water, D. M water etc. KPT brand Thermaplus Pipes and Thermal Fittings are having lot of advantages which can overcome the issues like leakages, pressure drop and corrosion – erosion in Metal Piping. Those are as under:

- **Leak proof Joining System:**

Thermaplus pipe and fittings provides leak proof joining throughout the life of pipes and fittings, because the joining system used in Thermaplus pipe and fittings is socket fusion welding where the outer diameter of the pipe and the inner diameter of fitting are heated and the joint is made. And there are two main advantages of this joining system, firstly the leak proof joining is created and secondly there is no ring created in the pipe which prevents scaling in the piping, wherein metal pipe; there is a threaded type of joint which creates leakages and increases the chances of scaling in the pipe. And in case of any plastic pipe; the joining system used is the Butt Welding where there is a ring created inside the pipe which will act like a barrier to any fluid or chemical which passes in the pipes and it also causes scaling in the pipes.

- **Non Corrosive & Rust Free Pipe:**

Thermaplus pipe and fittings is a non-metallic technology for industrial application. Generally industries use traditional metal piping system where they face huge problem of corrosion and rust as there was no other option which was later a cause for creation of leakage in the piping system but with Thermaplus pipe and fittings; you can have rust and leak proof piping.

- **NO Temperature loss and Minimum insulation:**

One of the major problems faced by any industrial user is the temperature loss. Many applications in which it becomes necessary to maintain the temperature; companies face problem of temperature loss and sweating from the piping in metal and any plastic pipes and that forces them to have a thick insulation which is very expensive and also maintenance leading. But with Sandwich Glass Fiber Technology in Thermaplus pipe and fittings; there is no temperature loss, as the thermal conductivity in Thermaplus pipe and fittings is 0.024 Btu/hr ft°F, which is 1700 times lesser compare to metal pipes and 11 times lesser compared to any plastic pipes. So the middle GLASS FIBER layer acts as insulation to the pipe. Hence, it requires minimum insulation.

- **Smoother iner surface with better flow & no scope of scaling:**

The roughness is calculated in terms of the RA Value and the RA Value of Thermaplus pipe and fittings is 0.07 Micron which is very much lesser compared to any metal pipes. And with higher RA Value there is more friction in the piping and hence in any metal piping there is lot of friction which affects the flow in the piping and it also creates scaling but Thermaplus pipe and fittings have smoother inner surface so there is no chance of friction and it gives very easy and smooth flow in the piping. Moreover there is no possibility of scaling in our piping.

Comparison of Thermaplus piping and Aluminium / Metal Piping

| Criteria | Thermaplus Pipes | Aluminium/Metal Pipes |
|-----------------------------------|---|--|
| Thermal Conductivity | Lowest Thermal Conductivity 0.013 Btu/hr leading to Negligible Heat Loss | Higher Thermal Conductivity 27.09 Btu/hr leading to higher Heat Loss |
| Friction Loss related to RA Value | Least RA Value i.e. 0.1 Micron prevent Friction Loss in the pipeline | 0.7 Micron RA Value leads to higher Friction Loss in the pipeline |
| Insulation | Sandwich Glass Fiber Reinforcement layer increases the temperature withstand capacity; in turn requires lesser insulation to prevent sweating | Owing to aluminium material, requires very thick insulation to prevent sweating and heat loss |
| Joining System | Socket fusion joining system assuring 0% leakage | 100% chances of leakages due to push fit joints depending on O-rings |
| C Value Related to high flow | 150C Value gives higher and smoother fiber reducing the energy consumption | 130C Value depending on O-rings consumers more energy |
| Pressure holding test | Glass Fiber Reinforcement composition with thermaplus pipe and fittings is successful in pressure holding test | Push fit joints depending on O-rings fails in pressure holding test |
| Energy saving | Energy saving due to 0% leakages | Higher energy consumption due to friction loss and leakage |
| Maintenance | NIL Maintenance having benefits such as Least Thermal Expansion and Sagging | High chances of Maintenance because of higher Thermal Expansion leading to sagging as well as Insulation |

Thermaplus Brand of K.P.T. Thermal FR+V0 Composite pipe

1. Absolutely Flame Retardant V2 Grade Pipes & fitting.
2. Almost double strength owing to Glass Fiber Reinforcement Technology.
3. Higher temperature resistance owing to inbuilt Glass Fiber Reinforcement layer.
4. Very less Thermal Expansion because of Sandwich Glass Fiber Reinforcement Layer.
5. 50% less clamping requirement compared to PPR Pipes due to Glass Fiber Reinforcement Layer.
6. NIL Maintenance having benefits such as Least Thermal Expansion and Sagging.
7. Owing to Sandwich Glass Fiber Reinforcement layer, very less sagging gives nice and Aesthetic View to the pipeline
8. Negligible Friction loss owing to higher C Value – 150 and Least RA Value – 0.1 Micron
9. Socket Fusion joining system guaranteeing 100% Leak Proof element in pipes.
10. No obstruction creation inside pipeline which leads to least Pressure Drop.
11. 100% Non Corrosive product provides absolutely Corrosion Free piping which does not create any leakage.
12. Up to 5% energy saving owing to least RA Value, higher C Value and 100% leak proof element
13. Higher flow rate 25% (bigger ID)
14. Energy saving 25%
15. Thermaplus pipes reduce passive heat loss by around 20% for non-insulated pipe.
16. Chemicals and acid applications
17. 4X lower linear thermal expansion

RANGE AVAILABLE IN PN 10, PN16 & PN 20

Technical Data of KPT Thermaplus Pipes:

| S.No. | PROPERTY | UNIT | KPT (PP-GF) PIPE |
|-------|--------------------------------------|---------|----------------------|
| 1 | Thermal Conductivity | Btu/hrs | 0.013 |
| 2 | Coefficient Linear Thermal Expansion | | 1.0X10 ⁻⁴ |
| 3 | Flexural Modulus | Mpa | 1300 |
| 4 | Tensile Strength at break | Mpa | 48 |
| 5 | Melting Temperature Rate | °C | 160-165 |
| 6 | Vicat Softening Temperature | °C | 147.5 |

Applications

1. Firefighting lines
2. Chemical and acid Plants
3. Cooling and chilled water
4. Hydraulic Oil (Pressure 20kgf)
5. Geo thermal application
6. Recycle water
7. Air conditioning
8. Potable water hot and cold
9. Solar Heaters application
10. Liquid foods
11. Watering system for greenhouse and gardens
12. Transportation aggressive fluids
13. Water purifying plants
14. Radiator heating
15. Traditional heating system
16. Air distribution and compressed air system

PRODUCT INSTALLATION
